

## Wound Treatments

At the Bakersfield Heart Hospital Center for Wound Healing, our goal is to not only to help our patients heal, but to prevent another non healing wound. Patients are active partners in their care, attending weekly appointments and learning how to care for their wound at home.

Because complications from wounds can cause a whole host of other issues, we ensure that our patient's treatments are individualized. The Center for Wound Healing offers the latest wound care technology along with traditional treatment options including:

### **Hyperbaric Oxygen Therapy**

Hyperbaric oxygen therapy is a method of administering highly concentrated oxygen to a patient that helps speed up the healing process.

### **Bioengineered Skin Substitutes**

Bioengineered skin substitutes consist of an outer and/or inner layer of skin planted into a support structure that temporarily takes over the functions of the skin until it can heal.

### **Debridement**

Debridement is dead, damaged or infected tissue is removed in order to improve the healing potential of the remaining tissue.

### **Advanced Dressing and Wraps**

Advanced dressing and wraps protect the wound from bacteria.
